

AT-VMx SERIES REPLACEMENT & UPGRADE STYLI MATRIX

The cartridge becomes worn after an extended period of play(3), even the finest diamond stylus. Our VM cartridges can be used again for a long time by only replacing the stylus. Our renewed VM cartridges series is composed of 7 styli and 3 types of bodies. Not only is it not necessary to buy the cartridge itself, but you can also enjoy the experience of upgrading your stylus, or trying a new cartridge / stylus combination.

(1) Becomes stereo wiring SP cartridge. Since the SP records only have monaural modulation, using mono body would be recommended.

(2) When playing the earliest mono LPs, there is a possibility that the stylus will touch the bottom of a record groove and produce unwanted noise.

*Lifetime of the replacement stylus is approx. 300 to 500 hours for Conical, 300 hours for Elliptical, 1000 hours for MicroLine®, and 800 hours for Shibata and Special Line Contact.

It is possible to combine an AT-VMx series replacement stylus with a cartridge body from the old VM series, but its performance and sound quality will differ from the latest lineup combinations.
